

# **Team SHIN: fEMR Sprint Review #2**

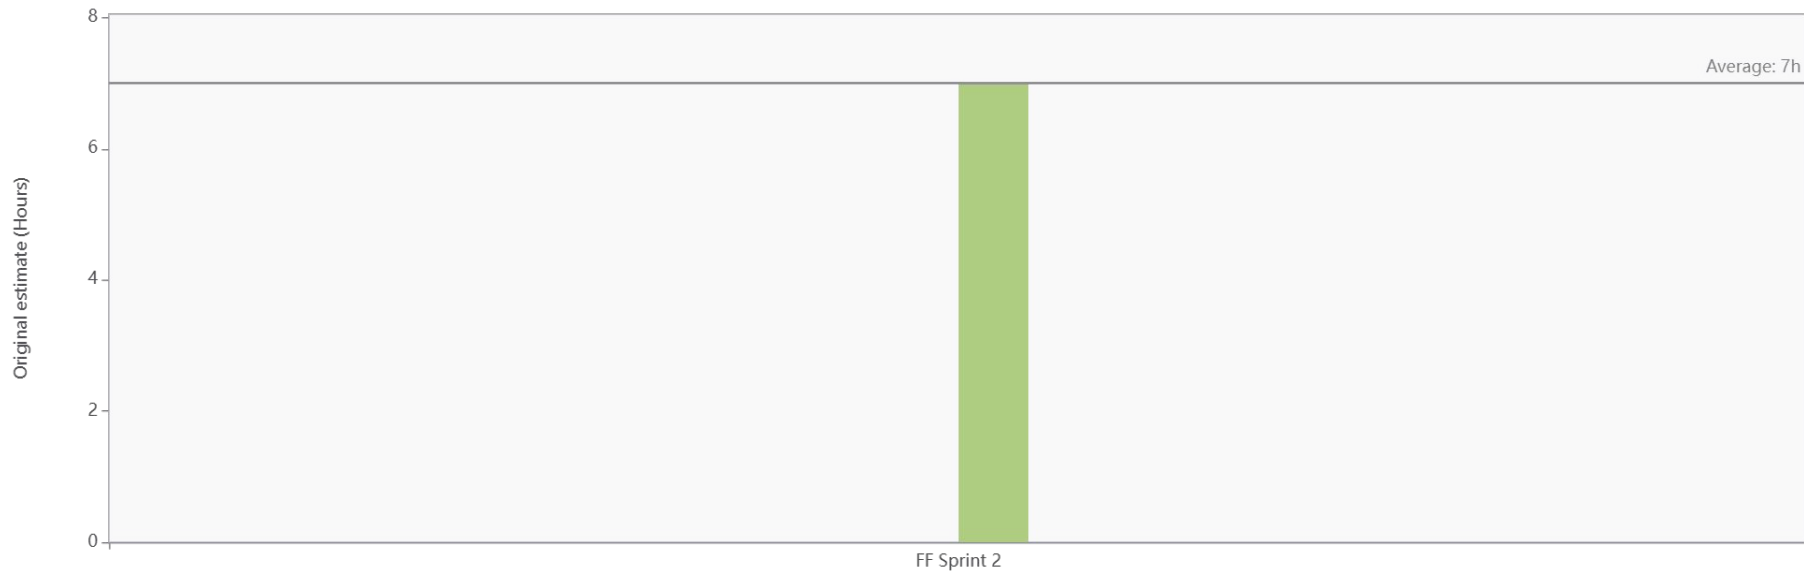

Team Members: Julian Labbe, Johnny Parini, Matthew Minh Phan,  
Eddy Resendiz, Kaito Rushworth

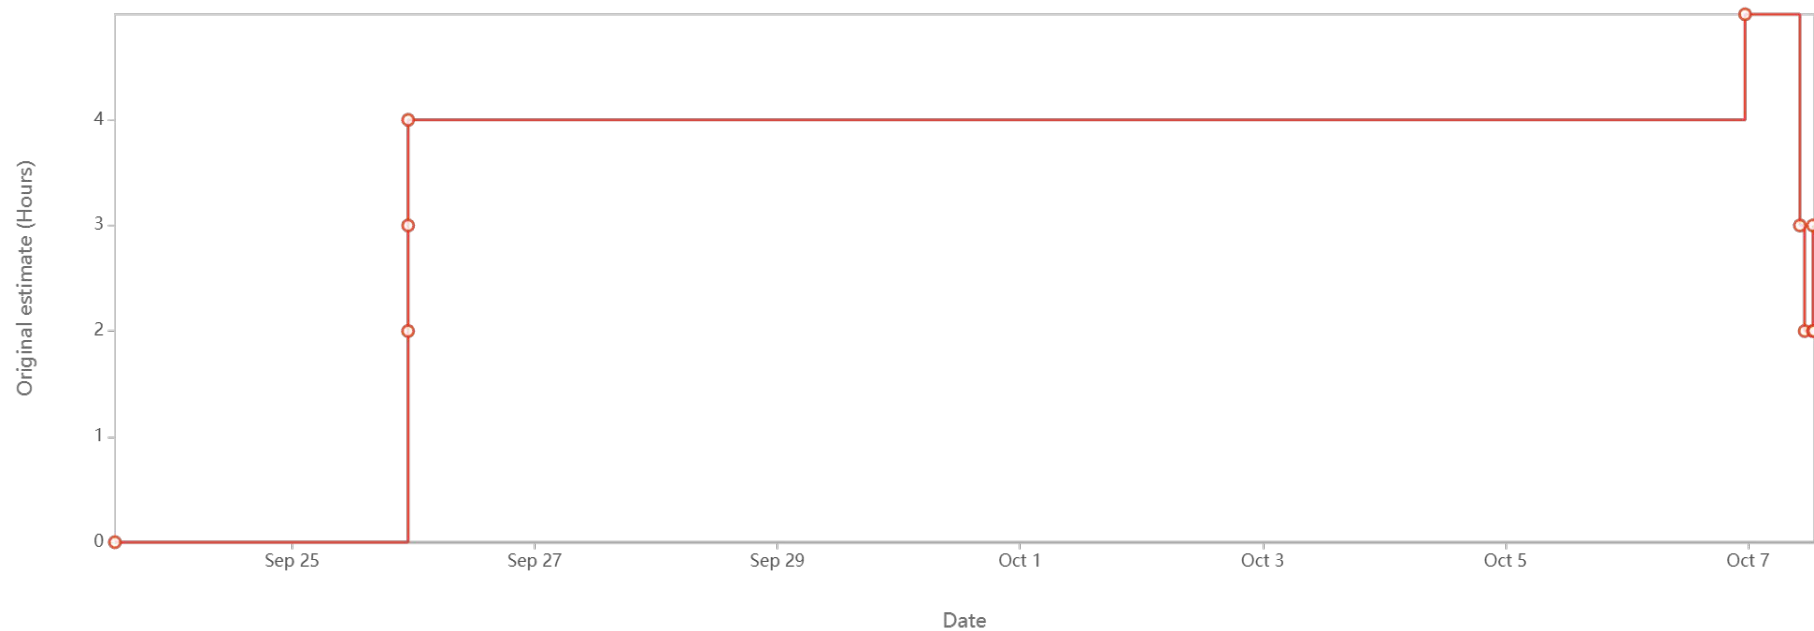

## Sprint #2 Goal

- Our goal was to determine what code we can repurpose for the CSV import, fix bugs and broken elements, and build any features missing from the original CSV implementation
- We wanted to update the old shopping list UI with the new one from Master
- We wanted visual error handling and we started the groundwork for this, but we haven't finished it

# Velocity chart

# Burndown Chart

# Improved CSV Import Error Handling

We changed how the app handles failed CSV uploads. If no file is selected or the import reports an error, the app prints a message in the console and returns to the inventory page instead of showing a server error page.

```
CSV import failed: {=CSV file header is not valid ...}
```

```
CSV import failed: no file was uploaded.
```

# **CSV Elements with New UI and Problems with Current Implementation (DEMO)**

We merged the old shopping list elements with the newest UI, fixing any merge errors

# Reflecting

- Issues with the current CSV implementation
  - Doesn't handle empty quantities
  - Fails on certain edge cases (comma in name)
  - No visual error indications (Yet)
- Prioritize Jira -> put all tasks on backlog, set priorities, log hours
- Challenges:
  - $\frac{4}{5}$  members of our team were sick during this sprint, poly plague!
  - Will carry momentum into the next sprint

# Next Sprint Tasks

- Visual error handling and validation (Top Priority)
  - The branch currently updates inventory row-by-row, so a malformed later row can leave earlier rows already changed. Skip lines that fail.
- Refactor CSV parsing
  - Prevent incorrect medication matches
- Build a downloadable formulary CSV template consistent with parser expectations
  - Provide the accepted columns, examples, and a direct “Download template” action from Inventory.
- Add an import preview before saving
  - Parse the uploaded CSV and show a table of “new medication,” “existing medication quantity change,” and “unmatched medication,” then require confirmation before writing to inventory

# Questions

- Should we continue to work from our project fork (shin-femr) for the rest of the project?
