

CSC 4160 – JIRA Presentation

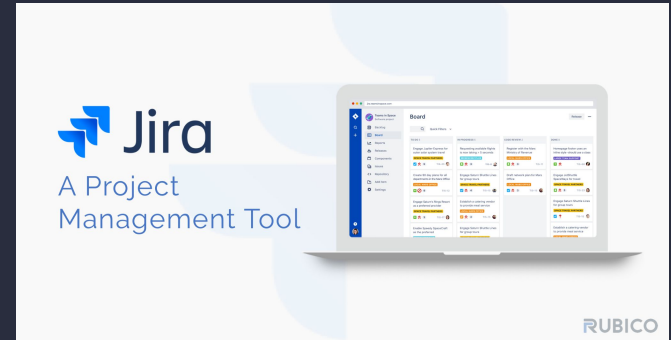

Presented by: Eddy Resendiz

Agenda

- Introduction
- Crash Course
- Work Demo
- Potential Usage
- Summary

Intro

- Jira is a project-management tool made by Atlassian.
- It helps teams organize, assign, and track work in one place.
- Teams can view progress through boards, lists, timelines, and calendars.
- Jira is widely used for software development, but it can support many types of projects.

History

- Jira was launched by Atlassian as Jira 1.0 in 2002 by Australian founders Mike Cannon-Brookes and Scott Farquhar
- It began as a tool for tracking software issues and bugs.
- Over time, it expanded to support Agile methods such as Scrum and Kanban.
- Jira later became available in the cloud, making it easier for distributed teams to collaborate.
- Today, Jira supports planning, tracking, reporting, and teamwork across projects.

Demo

Potential Usage in Capstone Projects

- Create a shared project board for the software product.
- Break the product into epics, user stories, tasks, and bugs.
- Assign each task to a teammate and set priorities and deadlines.
- Use a backlog to organize future work and plan upcoming sprints.
- Track progress with a Kanban or Scrum board, such as To Do → In Progress → Done.
- Use comments, attachments, and notifications to keep communication connected to each task.
- Review reports to identify delays, workload issues, and completed work.

Summary

- Jira gives teams one central place to plan and manage work.
- It has grown from an issue tracker into a flexible project-management platform.
- For a software team, Jira can clarify responsibilities, priorities, and progress.
- Using Jira consistently can make collaboration more organized and transparent.
